

Geographic units are identified by extended GISCO IDs, a harmonised coding scheme derived from Eurostat's NUTS. Extended GISCO IDs can take three forms, corresponding to different geographic levels: itemize

Country codes are two-letter codes. These are aligned with European Union conventions, which follow [https://www.iso.org/obp/ui/search/code/ISO 3166-1 alpha-2](https://www.iso.org/obp/ui/search/code/ISO%203166-1%20alpha-2) except for Greece (EL) and Kosovo (XK). This is the NUTS 0 level.

Regional GISCO IDs take the form CCL (NUTS 1 level), CCLL (NUTS 2 level), or CCLLL (NUTS 3 level) with CC a country code and each L alphanumeric. Prefixes identify parent units at a lower level, e.g., *PT10* is a subunit of *PT1* which is a subunit of *PT* (Portugal). Regional GISCO IDs are identical with the codes of the corresponding NUTS region for all regions in GISCO's typology.

Local GISCO IDs take the form CC_L...L with each L alphanumeric. Local GISCO IDs are identical with the codes of the corresponding LAU for all municipalities in GISCO's typology. Local GISCO IDs of the form CC_CCYYLL or CC_CCZZLL identify special local units following the conventions described in Section sec:special. Municipality-level units constitute the LAU 2 level, while identifiable groups of municipalities are coded at LAU 1 level and other local units constitute the Constituency level.
